

# Measurement of $P_{\mu\xi}$ in Polarized Muon Decay

Blair Jamieson

University of British Columbia  
CAP Congress, June 13, 2006

## OUTLINE

- Physics of  $\mu$  decay asymmetry
- Brief review of previous measurements
- Description of detector
- Analysis overview
- Systematic uncertainty estimates
- Data Sets, fits, and final results

# Muon Decay $\mu^+ \rightarrow e^+ \bar{\nu}_\mu \nu_e$

General derivative free interaction matrix element:

$$M = 4 \frac{G_F}{\sqrt{2}} \sum_{\substack{\gamma=S,V,T \\ \epsilon,\mu=R,L}} g_{\epsilon\mu}^\gamma \langle \bar{e}_\epsilon | \Gamma^\gamma | \nu_e \rangle \langle \bar{\nu}_\mu | \Gamma_\gamma | \mu_\mu \rangle \quad (1)$$

- $g_{\epsilon\mu}^\gamma$  are the decay coupling constants
- $\gamma = S, V, T$  are the scalar, vector, and tensor interactions
- $\epsilon, \mu = L, R$  are the chirality of the electron or muon
- SM: all zero coupling constants, except  $g_{LL}^V = 1$

# Physics of $\mu$ decay asymmetry

- $P_\mu$  is the polarization of the muon,  $\xi$  is the asymmetry in angle of the decay positrons from normal  $\mu$  decay
- Standard Model (V-A) predicts  $\xi = 1$  and  $P_\mu = 1$

$$\frac{d^2\Gamma}{dx d\cos\theta} \propto F_{IS}(x, \rho, \eta) + P_\mu \xi \cos\theta_{\text{spin}} F_{AS}(x, \delta) \quad (2)$$

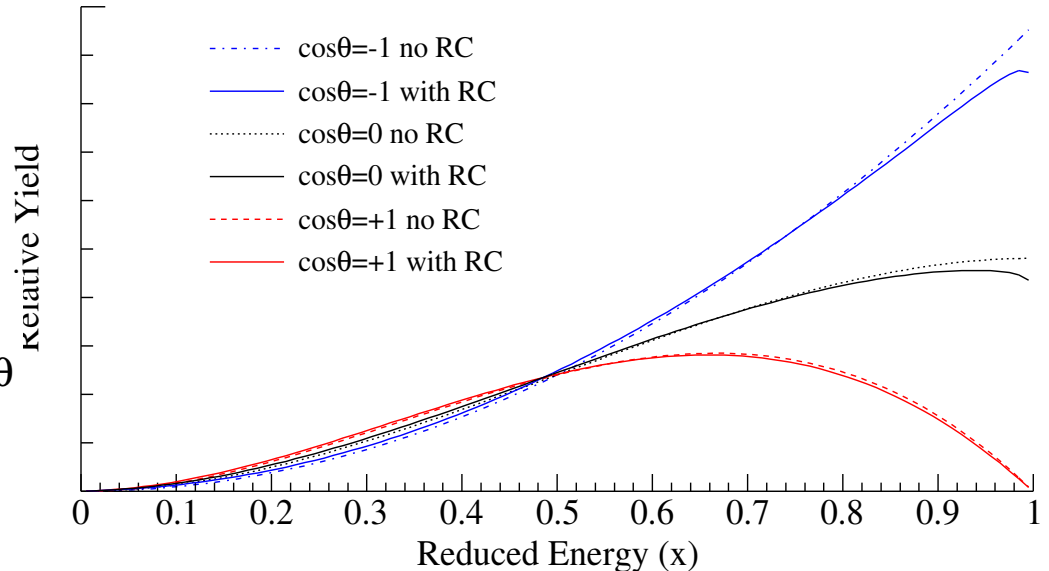

$$x = E_e/W_{e\mu}$$

$$W_{e\mu} = \frac{m_\mu^2 + m_e^2}{2m_\mu}$$

$$x_0 = \frac{m_e}{W_{e\mu}}$$

Muon Decay Positron Energy Spectrum

# Measurements and Motivation for $P_\mu\xi$

- Direct Measurements at PSI and TRIUMF:
  - $P_\mu\xi = 1.0027 \pm 0.0079 \pm 0.0030$  (Beltrami et al, PL **B194** 1987)
  - $P_\mu\xi\delta/\rho > 0.99682$ , 90% conf. level (Jodidio et al, PR **D34**, PR **D37** 1986)
- Indirect Measurement (*TWIST*  $\rho/\delta$  PRL **94**, 101805 + PRD **71**, 071101(R) (2005)):

$$0.9960 < P_\mu\xi \leq \xi < 1.0040 \text{ at 90\% conf. level}$$

- $\xi$  and  $\delta$  limit the probability of a right-handed muon decaying into any handed positron:

$$Q_R^\mu = \frac{1}{2}\left(1 + \frac{1}{3}\xi - \frac{16}{9}\xi\delta\right) \quad (3)$$

- In Left-Right Symmetric Models,  $P_\mu\xi$  sets limit on  $W_L/W_R$  mass ( $\epsilon = \left(\frac{g_R M_1}{g_L M_2}\right)^2$ ) and LR mixing parameter ( $\zeta_g = \frac{g_R}{g_L}\zeta$ ): (Herczeg, PR **D34**)

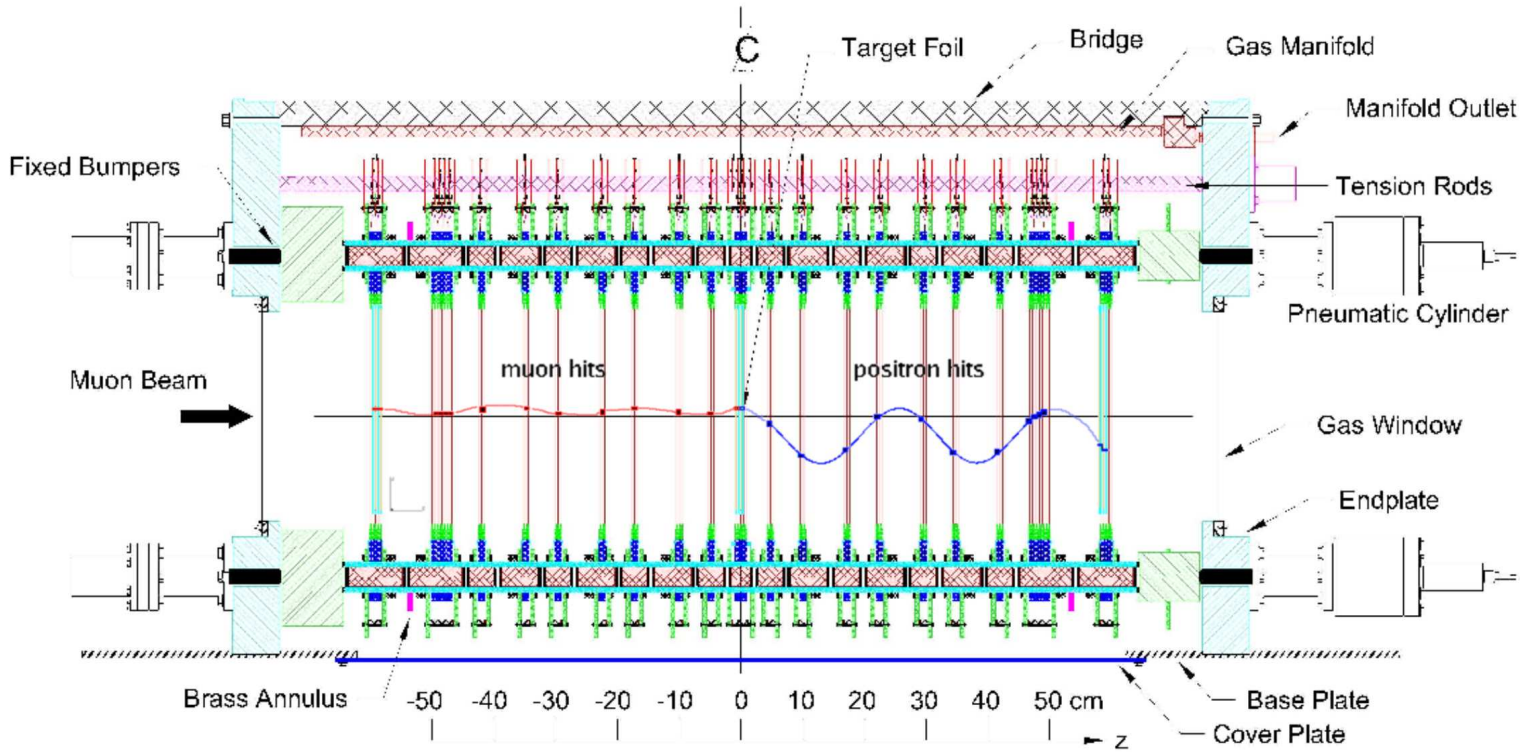

$$P_\mu\xi \approx 1 - 2\epsilon^2 - 4\zeta_g^2 - 2\epsilon^2\left(\frac{\cos\theta_1^R}{\cos\theta_1^L}\right)^2 - 4\epsilon\zeta_g\frac{\cos\theta_1^R}{\cos\theta_1^L}\cos(\alpha + \omega) \quad (4)$$

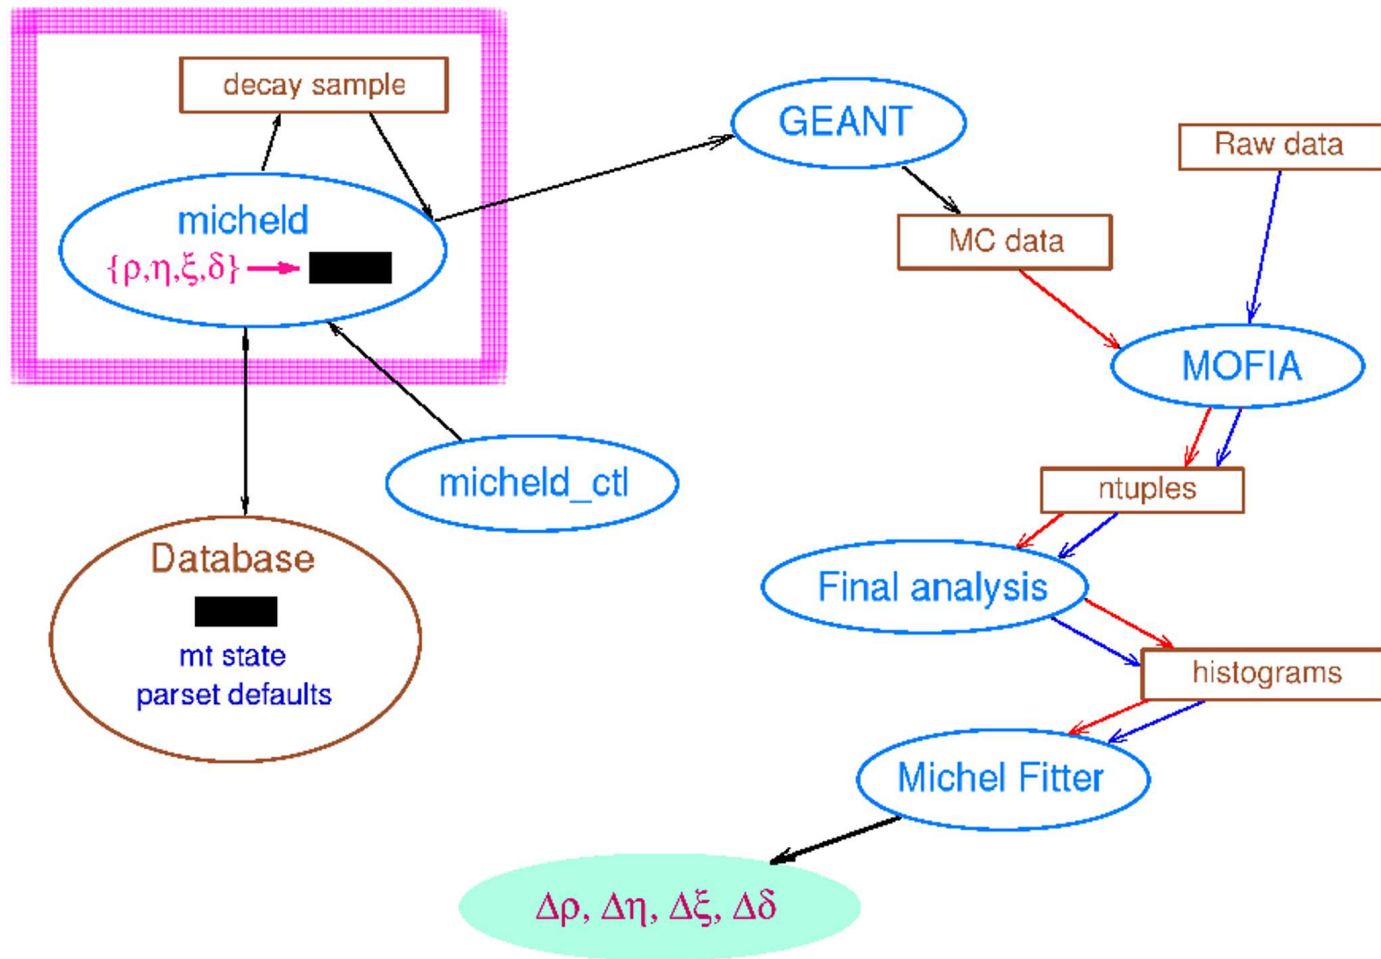

# Locations of Muon Depolarization

# TWIST Detector

# Blind Analysis Strategy

# Spectrum Fits $\lambda = (\rho, \eta, P_{\mu\xi} | P_{\mu\xi\delta}, P_{\mu\xi\delta})$

# Systematics for TWIST $P_{\mu\xi}$

Systematic Effect	Uncertainty ( $\times 10^3$ )	Total
<b>Muon Beam and Polarization</b>		<b>3.69</b>
fringe field (ave)	3.40

<b>Total Systematic Uncertainty</b>		<b>3.8</b>

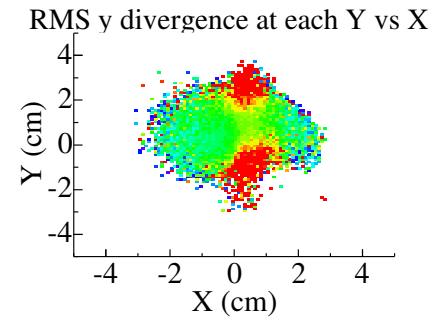

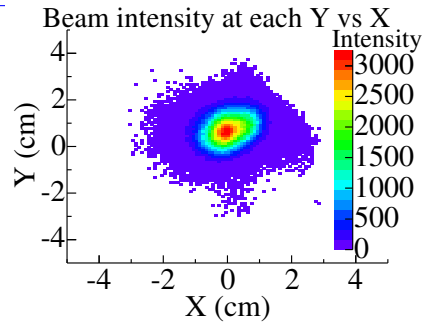

# Fringe field depolarization

- Muons depolarized in fringe field of the solenoid:  $P_\mu \propto \theta_\mu^2/2$
- Estimated from difference in begin and end run beam characterization

# $P_\mu$ from TEC beam reproducibility

B2 (mT)	$\bar{x}$ (cm)	$\bar{\theta}_x$ (mrad)	$\bar{y}$ (cm)	$\bar{\theta}_y$ (mrad)	$P_\mu^{\text{sim}}$
94.4	0.07	-5.9	0.97	7.0	0.9929
94.9	0.85	-1.1	0.87	-5.0	0.9955
94.4	0.06	-6.7	0.73	-11.2	0.9941
94.9	0.94	-1.5	0.64	-19.2	0.9922

# Material Dependent Muon Depolarization

- Gaussian or exponential extrapolation?
- Systematic uncertainty in  $P_\mu \xi$  is 0.0012

# Data Set Summary for *TWIST* $P_{\mu\xi}$

Set #	# Runs (2 GB)	Description
30	60	B2=949G, z cent, M1 Trigger
31	265	B2=949G, z cent, M Trigger
32	120	B2=944G, PC5 Stops
33	91	Far Upstream Stops
34	11	Far Downstream Stops
35	368	2004 Nominal Stops centered
36	390	2004 Stops at 3/4 position
37	281	High Rate
38	303	Aperture In
39	211	2004 Stops at 3/4 position
Total	2100 (4.2 TB)	1998 Nominal Runs

# Data Set Consistency

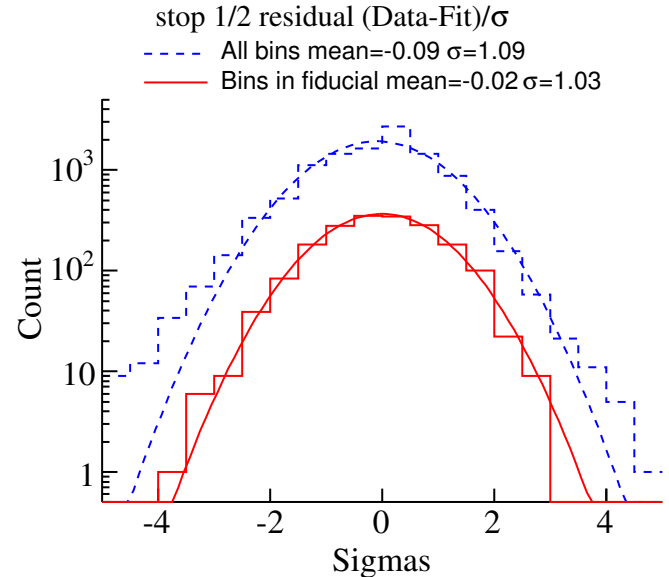

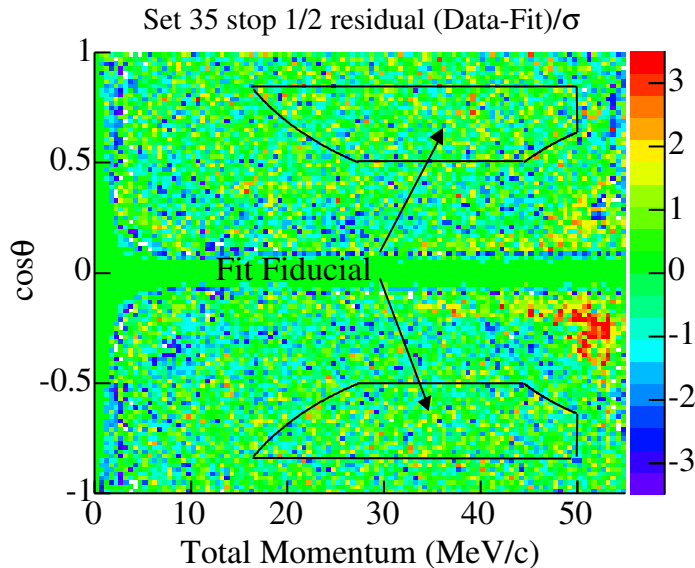

- Consistency check (difference from value hidden in simulation)
- Red=statistical uncertainty, Black=stat+set-to-set systematic unc.

$\Delta P_{\mu\xi}$  Corrected

# Spectrum Fit Result

- Data to simulation spectrum fit residuals look reasonable
- Residual from all fits look similar
- $P_{\mu\xi} = 1.0003 \pm 0.0006$  (stat)  $\pm 0.0038$  (syst)  
(hep-ex/0605100)

# Conclusion

- Preliminary *TWIST* measurement, consistent with standard model (hep-ex/0605100):

$$P_{\mu\xi} = 1.0003 \pm 0.0006 \text{ (stat)} \pm 0.0038 \text{ (syst)}$$

- Result reduces uncertainty in PDG value by a factor of about 2. Current PDG value =  $1.0027 \pm 0.0079 \pm 0.0030$ .
- Largest systematic uncertainty is due to fringe field depolarization

*TWIST* is funded by NSERC, DOE, Russian Ministry of Science.

Special thanks to Westgrid computing resources and to the *TWIST* collaboration.

# Extra Slides

# Preliminary Unblinded $P_{\mu\xi}$

- $P_{\mu\xi} = 1.0003 \pm 0.0006(\text{stat}) \pm 0.0038(\text{syst})$
- Red=statistical uncertainty, Black=stat+set-to-set systematic unc.

# Model Independent Muon Handedness

$$Q_R^\mu = \frac{1}{2} \left( 1 + \frac{1}{3}\xi - \frac{16}{9}\xi\delta \right)$$

# Estimating Systematic Uncertainty

- Total systematic uncertainty is:

$$\epsilon_{sys}^{tot} = \sqrt{\sum_i (\epsilon_{sys}^i)^2} = \sqrt{\sum_i \frac{\sigma_i^2}{R_i^2} S_i^2} \quad (5)$$

- sensitivity measurement  $S_i$ , is difference in muon decay parameter for an ...
- ... exaggerated change  $R_i$  in an effect
- RMS change in an effect in data  $\sigma_i$
- scale factor  $R_i/\sigma_i$

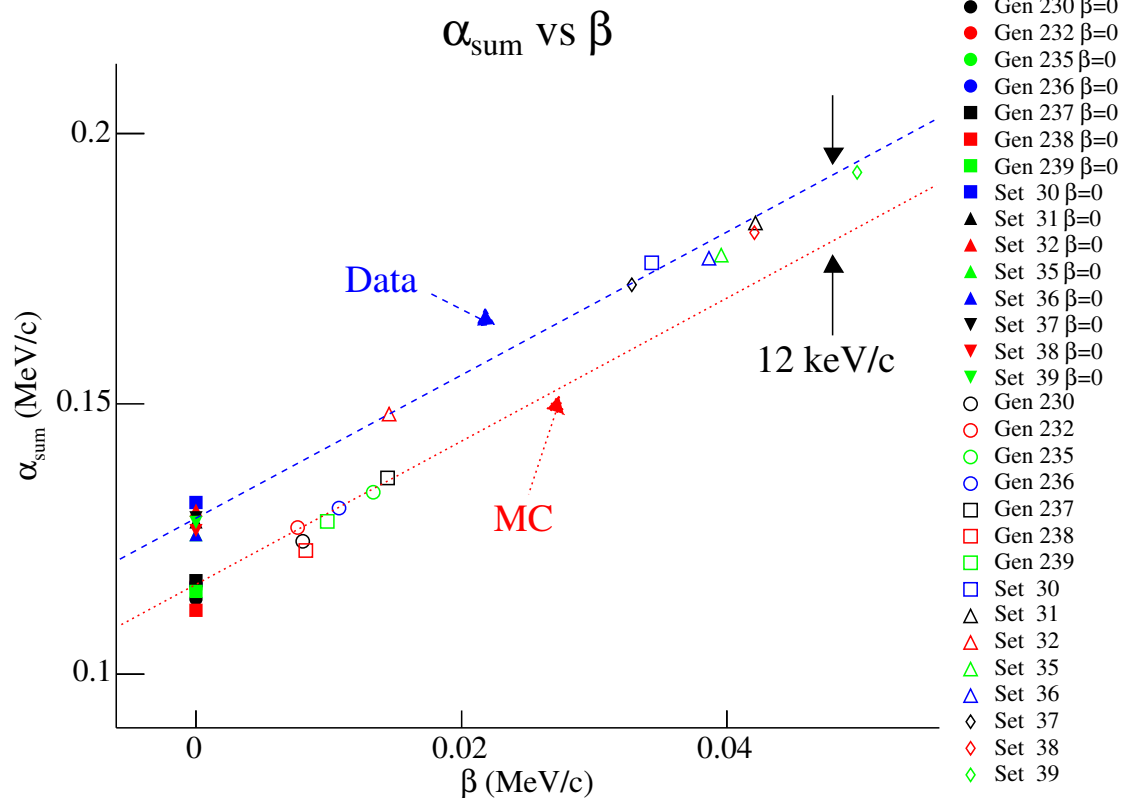

# Time Calibration Systematic Uncertainty

- Sensitivity from fit of spectra from data analyzed with different calibration files:
  - nominal
  - offset by  $10 \times \sigma_i$
- measure  $S_i = (8.9 \pm 2.3) \times 10^{-3}$ , scale factor  $R_i/\sigma_i$  of 10
- Systematic uncertainty in  $P_\mu \xi$ :  $0.89 \times 10^{-3}$
- Also tried with scale factor of 5 to confirm linearity

Nominal and 10x Exaggerated Time Calibrations

# Energy Calibration Correlations

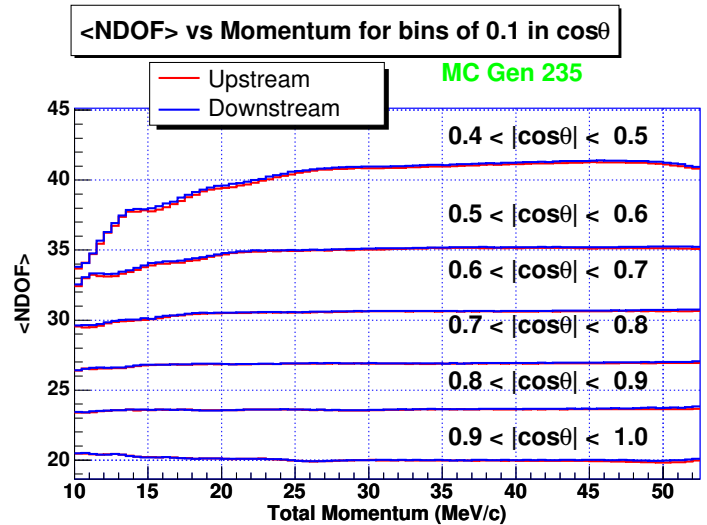

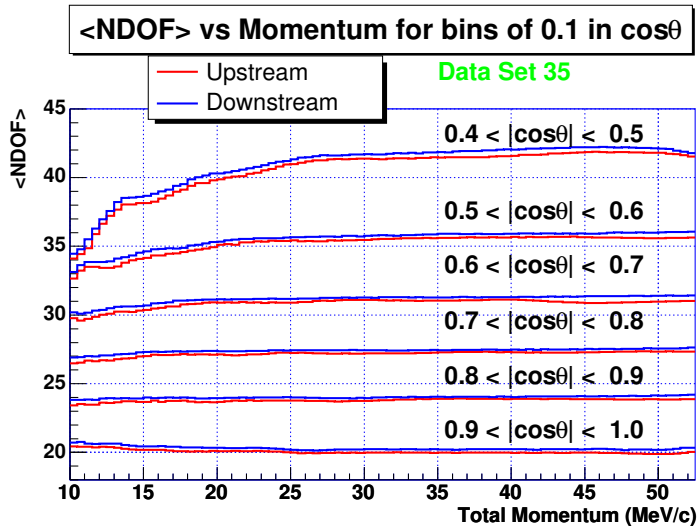

# GEANT Validation

- From fits to two halves of decay positrons from far upstream stops
- Discrepancy in tails in momentum of 4%, and in  $\theta$  of 8%
- Overall 5% discrepancy in hard interactions

# Upstream-Downstream Efficiency

- Difference of 0.18 NDOF between downstream MC and Data
- MC with 5% downstream inefficiency had 1.8 fewer NDOF
- Fit of normal MC to ineffic. MC change in  $P_\mu \xi$  of  $(1.9 \pm 0.9) \times 10^{-3}$
- Systematic unc. due to US/DS Inefficiency is  $0.2 \times 10^{-3}$
